

STRENGTHENING SECURITY FOR BUSINESS DEVELOPMENT

Pentel in Japan enhances network protection with a next-generation firewall that also supports continued growth

Business need

Pentel looked to enhance its network protection through deep packet inspection and data analysis when its existing firewall solution came to the end of its working life.

Solution

The company installed a SonicWall Network Security Appliance (NSA) 5600 firewall to improve protection across its IT platform.

Results

Today, Pentel is strengthening its network against attacks using the reports from SonicWall.

The solution's SonicWall Analyzer network security software captures incident data and performs analysis that is then presented as reports back to IT personnel at Pentel. These reports are reviewed by executives, helping them to formulate a long-term network protection strategy.

Benefits

- Increased performance and scalability with a multi-core architecture
- Simplified security thanks to intuitive controls
- Greater cost-effectiveness compared with other leading firewalls
- Improved network protection through better network visibility
- Enhanced responsiveness to attacks with centralised control

Solutions at a glance

- [Network Security](#)

“It was clear to us that the UTM functionality and cost of the SonicWall NSA 5600 was superior to the competition.”
