

FOSTER CLARK PRODUCTS LTD.

“At Foster Clark, our daily production, management and administrative tasks all rely on our IT systems in order to run efficiently. It is, therefore, in our best interest to safeguard these systems from any internet security threats. With a growing reliance in IT, we have over time invested in and upgraded our security systems to stay on top of any information security threats that may cause harm, whilst also giving importance to user education with regards to identifying and reporting incidents.

“As a measure to protect ourselves better against an ever-changing threat landscape, when looking at our next firewall upgrade, we had one main requirement: that it supports next-generation firewall (NGFW) features.

“The sought after ‘sandboxing’ feature in the SonicWall Capture ATP service gives us much more peace of mind that our users are accessing files from the internet safely; especially with our current setting to ‘Block Until Verdict,’ which only allows access to the file after it has been verified as safe. This is a fair trade-off of security for a little less convenience, which usually only takes seconds to confirm. There are detailed reports for each file checked, meaning a follow-up can be carried out if required.

“DPI-SSL is another feature that we have benefited greatly from since implementing SonicWall. With more than two thirds of our internet traffic in HTTPS, we previously could not identify traffic or apply content filtering in an efficient way.

More importantly, all packets are now scanned and checked for malicious content before being sent off to their destination. We have DPI-SSL enabled on all security services on the firewall, with no sign of negative impact in day-to-day operations since being implemented.

“Moreover, the transition to SonicWall has been made that much easier thanks to the interface, which is intuitive and fast to use on a daily basis.”
