API Overview

SonicWall MySonicWall has developed a RESTful (Representational State Transfer) API (Application Program Interface). This allows customers to either script or build custom user interface elements to manage MySonicWall if they do not want to use the default user interface. MSPs (Managed Service Providers) may find this feature especially useful when customizing the product for their use.

Terminology

This document uses the following terminology and acronyms:

Term	Definition
API	Application Program Interface
CRUD	Create, read, update, delete. These map to the HTTP verbs as:

Term	Definition
	DELETE Delete
	GET Read
	PATCH Update/modify
	POST Create
	PUT Update/replace
cURL	A command-line tool for getting and sending files using URL syntax.
DUT	Device Under Test
Filter	May be used to apply a policy that traps issues or protects sensitive data or data. Also refers to the process of narrowing a search.
JSON	JavaScript Object Notation. A syntax for storing and exchanging data in a format very similar to JavaScript Objects that is both human and machine readable.
Policy	The rules or elements that govern computer usage within your company. These include the corporate rules about how to monitor and protect sensitive data or system.
REST	Representational State Transfer
Swagger	An open source framework for APIs. Also known as the Open API Initiative.

Description

APIs are the most common way for different companies and products to integrate with each other as a part of a business ecosystem. REST is an architectural style used for creating web services within this ecosystem. REST-compliant, or RESTful, web services allow the requesting systems to access and manipulate web resources, through an API, by using a uniform and predefined set of stateless operations. This allows a programmer to access exposed objects or actions within the system so things can be customized.

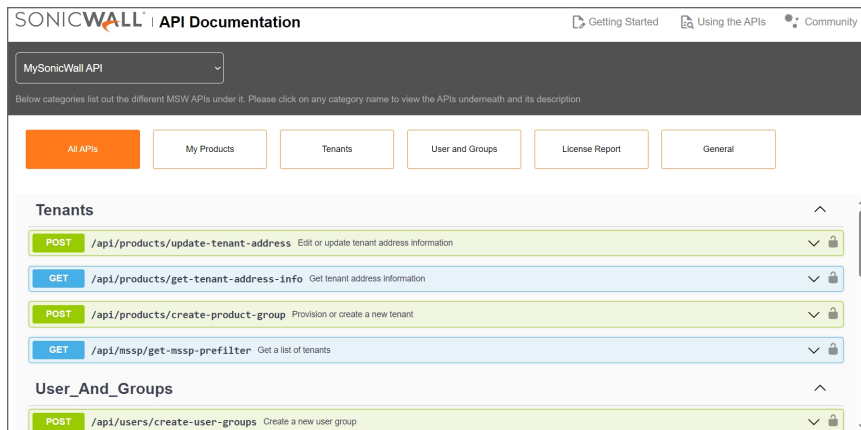

The server does not maintain a state because RESTful APIs are stateless. The client maintains the state. The server can provide a state to the client via a token. The client then maintains and returns the token when accessing the server. Since the state is in the token given to the client—even if the server goes down or the client contacts another server in a cluster—the client can still interact properly with the server.

The API uses HTTP and HTTPS requests to GET, PUT, POST or DELETE data. This API reference guide documents the individual calls but also allows you to try out the individual calls and get sample cURL calls that can be dropped into shell scripts.

TheMySonicWall team uses Swagger (also known as the Open API Initiative) to provide the API documentation. It's built into the code and renders it in a clean and clear way. It also provides an interactive test tool when you customize an operation. The output is provided in JSON format.

Accessing the API Documentation

Every MySonicWall host has API documents built into the product. You can click the **Getting Started** or **Using the APIs** on top of the page to access the documentation. Go to <https://api.mysonicwall.com/mssp.html> to access the API Documentation page and also to try out the API functions.

How to Use the Swagger Interface

The RESTful APIs are a set of JSON objects that define their naming, order, and contents. By standardizing the API, each of its component can be displayed in a stylized, interactive framework. Within that framework, you can learn about a specific API and try it.

Before making any requests through API, generate the MSW API Key in MySonicWall. For more information, refer to [Generating MSW API Key](#).

① **NOTE:** You need to generate the API key before you try any of the other operations. This tells you what the response looks like and how it is structured, so you can decide how to parse it. Preview what happens prior to finalizing.

Supported Request Methods

The MySonicWall API utilizes four of the methods that HTTP protocol (RFC 7231 and RFC 5789) defines to create, read, update and delete (CRUD) resources. Below table describes the supported HTTP methods.

SUPPORTED HTTP REQUEST METHODS

HTTP method	Description
GET	Retrieves the specified resource or collection of resources. GET is a read-only operation that does not alter appliance state or configuration. A GET operation should not contain a request-body.
POST	Submits data to be processed by the specified resource or collection of resources. In most cases, MySonicWall APIs uses the POST verb to create and add a resource to a collection of resources (for example, add a new Tenant or create a new user).
PUT	Updates the specified resource. The data included in the PUT request-body replaces the previous configuration.
DELETE	Deletes the specified resource or collection of resources.

Generating MSW API Key

- ① **NOTE:** All MySonicWall users can generate API key to use in the Swagger or any other API platform. Most MSW APIs support monthly billing work flows at this time but other users can utilize MSW API key to generate NSM token and access NSM APIs.

To generate MSW API key:

1. Login to <https://www.mysonicwall.com/>.
2. Navigate to **Monthly Billing | Access Management > Users** or **My Workspace | User Groups > User list**.
3. Click **Generate My API Key** on top of the table.
4. Enter **Description, Source IP Address (optional)** for the MSW API Key.
By the default, **Validity** of the key is set for 1 year. Maximum duration of the API key is 1 year. However, you can set the custom validity of any duration under 1 year, if required.
5. Click **Confirm**.
6. Click the **Copy to clipboard** icon to copy the **API Key**.

- △ **CAUTION:** You cannot view or copy the API key once you close the **GENERATE API KEY** pop-up window. Make sure that the API key is copied and saved to use in the Swagger or any other API platform.

7. Click **Close**.

- ① **NOTE:**
- Admin of the account can view the API keys generated for the users. If required, admin can revoke the API Key.
 - Your API access is determined based on the access levels in MySonicWall.

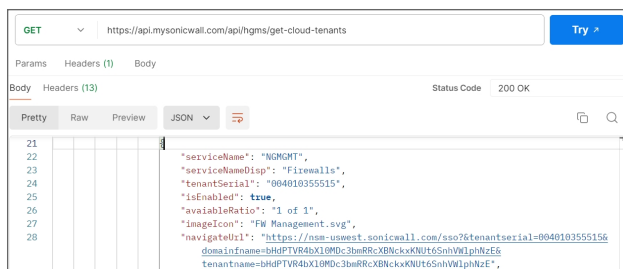

Generating NSM Token using MySonicWall API Key

You can generate the NSM token using MySonicWall API key.

To generate NSM token using MSW API key:

1. Get your **tenantId** and **tenantserial** using the MSW API Key.

You can find **tenantId** and **tenantserial** on the MySonicWall Swagger page under **General** category with API call, **GET** <https://api.mysonicwall.com/api/hgms/get-cloud-tenants>.

2. Get an **access code** for your tenant using the **MSW API Token** and the **tenantId**.

Replace the **YOURTENANTID** with **tenantId** you received in step 1 and replace **YOURAPIKEY** with **APIKEY** generated according to [Generating MSW API Key](#) in the below curl example.

Curl-based example: `curl https://api.mysonicwall.com/api/generate-cscaccesscode -X POST -d '{"tenantId":"'YOURTENANTID','tileName':'ISNSMSAFEENABLED'}' -H 'Content-Type: application/json' -H 'X-API-KEY: YOURAPIKEY'`

3. Generate the NSM API Token using the **tenantserial** and **access code**.

Replace the **YOURTENANTSERIAL** with **tenantserial** you received in step 1 and replace **YOURACCESSCODE** with code you received in step 2 in the below curl example.

Curl-based example: `curl https://nsm-uswest.sonicwall.com/api/manager/auth/sso -H 'Content-Type: application/json' -X POST -d '{"tenantserial":"'YOURTENANTSERIAL','code":"'YOURACCESSCODE'}'`

NOTE:

- Use the NSM API Token for NSM API calls for that specific tenant.
- The NSM API token you generated is valid for 8 hours. It has an inactivity timeout of 15 minutes. This is tied to the session timeout for your user in NSM. You can extend the inactivity timeout to the maximum of 8 hours through the NSM UI.
- The **tenantserial** is not same as **tenantId**. The **tenantserial** for NSM is available as a separate parameter in response body of step 1.
- Your NSM region is the domain for the SonicWall NSM portal you log into. For Europe region, NSM URL should be changed to <https://nsm-eucentral.sonicwall.com/api/manager/auth/sso>.

Generating Capture Client Token using MySonicWall API Key

You can generate the Capture Client token using MySonicWall API key.

To generate Capture Client token using MSW API key:

1. Get your Capture Client **tenantId** (ProductGroupID) using the MSW API Key.

You can find the ProductGroupID for Capture Client on the MySonicWall Swagger page under **General** category with API call, GET <https://api.mysonicwall.com/api/hgms/get-cloud-tenants>.

2. Get an **access code** for your tenant using the **MSW API Token** and the **tenantId** (ProductGroupID).

Replace the **tenantid** with **ProductGroupID** you received in step 1 and replace **YOURAPIKEY** with **APIKEY** generated according to [Generating MSW API Key](#) in the below curl example.

Curl-based example: `curl https://api.mysonicwall.com/api/generate-cscaccesscode -X POST -d '{"tenantId":"YOURTENANTID","tileName":"ISNSMSAFEENABLED"}' -H "Content-Type: application/json" -H "X-API-KEY: YOURAPIKEY"`

❗ | **NOTE:** The generated **access code** is valid only for 5 minutes.

3. Generate the Capture Client API Token using the **access code**.

Sample API call: `POST https://captureclient-36.sonicwall.com/api/auth/getApiToken?cscaccesscode=NF80MDYzMTE4Ml5DNTYzQzk2QTFFQkE0RjA1ODk2MjU4RjJDQzA5Njk1OQ=`

❗ | NOTE:

- Use the Capture Client API Token for Capture Client API calls for that specific tenant.
- For more information about CC API queries, refer to Capture Client API docs - captureclient-36.sonicwall.com/api/docs/.
- The Capture Client API token you generated is valid for 7 days.
- Your Capture Client region is the domain for the SonicWall Capture Client portal you log into. For Europe region, Capture Client URL should be changed to <https://captureclient-36eu.sonicwall.com>.

Sample API Functions

SonicWall provides many API functions with MySonicWall. A full list of the API functions are listed in Function List for your reference. The API functions reviewed here provide a cross section of how the different APIs work.

The Swagger User Interface generates an interactive documentation website of the MySonicWall API. For more information about the Swagger interface, refer to [How to Use the Swagger Interface](#).

① | **NOTE:** MySonicWall API supported authentication method is- X-API-KEY in request header.

Topics:

- [Provisioning a Tenant](#)
- [Provisioning a New Product or Editing an Existing Product](#)
- [Inviting a New User](#)

Provisioning a Tenant

The operation **POST/api/products/create-product-group** provisions a tenant in the MySonicWall. This API call consumes the body parameter via the request header and produces the response vial the response header.

Topics:

- [Request Parameters](#)
- [Response Class Example Value](#)

Request Parameters

The **Parameters** section of the **POST/api/products/create-product-group** operation identifies the types of variables that are passed during the operation. You can customize some of these variables and then test the API with those new settings.

When you click **Try it out**, the request body turns to white background with an editable copy. You can then make changes to the variables and click **Execute**.

POST /api/products/create-product-group Provision or create a new tenant

Parameters

No parameters

Request body

application/json

```
{
  "productGroup": "Tech",
  "tenantId": "12345",
  "tenantName": "TechCorp",
  "tenantAddress": "123 Main St",
  "tenantPhone": "555-1234",
  "tenantEmail": "info@techcorp.com",
  "tenantWebsite": "http://www.techcorp.com",
  "tenantStatus": "Active",

Provisioning a New Product or Editing an Existing Product

The operation **POST/api/mssp/allocatemsspproductservices** provision or edit the selected product under the selected MSSP in the MySonicWall. This API call consumes the body parameter via the request header and produces the response vial the response header.

- [Request Parameters](#)
- [Response Class Example Value](#)

Request Parameters

The Parameters section of the **POST/api/mssp/allocatemsspproductservices** operation identifies the types of variables that are passed during the operation. You can customize some of these variables and then test the API with those new settings.

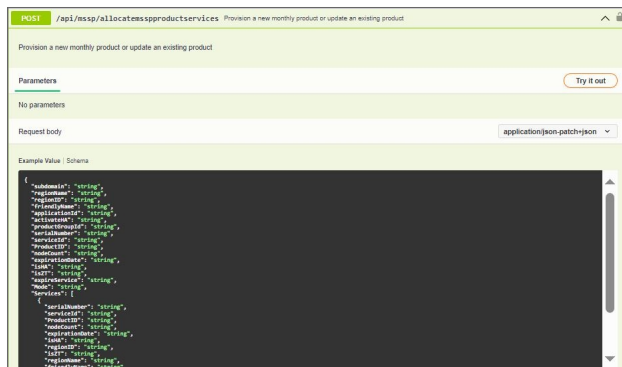

To provision a new Product, first you need to get the Monthly Billing Product's parameters like corresponding ProductID, serviceId, regionName, regionID, etc.

To get the applicable product details, run the API query, **GET /api/mssp/applicable-mssp-product-services** using your MSW API key.

The screenshot shows a web interface for the API endpoint **GET /api/mssp/applicable-mssp-product-services**. The title bar indicates the operation is for getting a list of applicable products, services, and data center details. Below the title, there is a "Parameters" section with a "Try it out" button. The parameters are listed in a table with columns for Name, Description, and Default value. The parameters are: TenantID (integer(5int32), Default value: 0), serviceId (integer(5int32), Default value: 0), serialnumber (string, Default value:), and Mode (string, Default value:). Each parameter has an input field with the default value or an empty string.

Name	Description	Default value
TenantID	integer(5int32) (query)	0
serviceId	integer(5int32) (query)	0
serialnumber	string (query)	
Mode	string (query)	

When you click **Try it out** to run the **POST/api/mssp/allocatemssproductservices** endpoint, the request body turns to white background with an editable copy. You can then make changes to the variables and click **Execute**.

Sample to provision Capture Client:

mode=PROVISION

```
{
  "productId": "401",
  "serviceId": "6759",
  "nodeCount": "99999",
  "expirationDate": "Never",
  "regionName": "San Jose, North America",
  "regionId": "1",
  "serialNumber": "",
  "productGroupId": "2356529",
  "friendlyName": "Capture Client - MSSP ABC Tenant",
  "isHA": "NO",
  "Mode": "PROVISION"
}
```

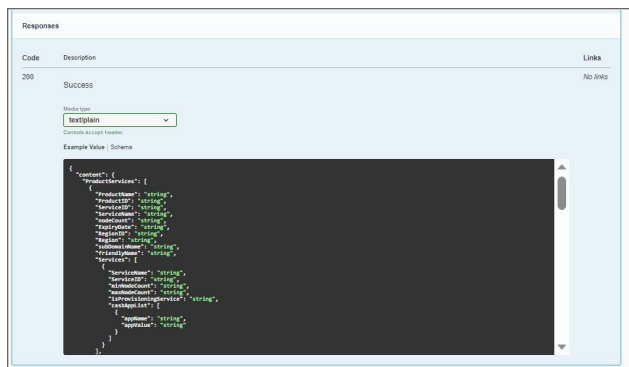

Sample to edit an existing Monthly Billing Product (Capture Client):

Mode= EDIT

```
{
  "productId": "401",
  "serviceId": "6759",
  "nodeCount": "100",
  "expirationDate": "Never",
  "serialNumber": "CC000002B10C",
  "productGroupId": "2356529",
  "friendlyName": "Capture Client - MSSP ABC Tenant",
  "isHA": "NO",
  "Mode": "EDIT"
}
```

Response Class Example Value

The Response Class **Example Value** shows the read-only response code for the **POST/api/mssp/allocatemsspproductservices** function. The **Example Value** view is the default view.

Inviting a New User

The operation **POST/api/users/add-user** send an invite to a new user under the selected User Group in the MySonicWall. This API call consumes the body parameter via the request header and produces the response vial the response header.

Topics:

- [Request Parameters](#)
- [Response Class Example Value](#)

Request Parameters

The Parameters section of the **POST/api/users/add-user** operation identifies the types of variables that are passed during the operation. You can customize some of these variables and then test the API with those new settings.

When you click **Try it out**, the request body turns to white background with an editable copy. You can then make changes to the variables and click **Execute**.

POST

/api/users/add-user

Add or invite a new user to a user group

Add or invite a new user to a user group

Parameters

No parameters

Request body

application/json-patch+json

```
{
  "username": "new",
  "emailAddress": "johndoe@gmail.com",
  "firstName": "John",
  "lastName": "Doe",
  "accessToken": "SECRET",
  "accessTokenExpirationDate": true
}
```

Example

Clear

Response Class Example Value

The Response Class **Example Value** shows the read-only response code for the **POST/api/users/add-user** function. The **Example Value** view is the default view.

[illegible]

MySonicWall API Support

MySonicWall API support is available through SonicWall communities only under Developer Hub. To access community, go to: <https://community.sonicwall.com/technology-and-support/categories/developer-hub>. Customers can post their questions and SonicWall staff monitors and respond.
